Project

TEST RUN-1

1 User Load

This assessment will form part of your project submission, designated as Test Run 1 , and will contribute **10%** towards your overall class grade. The deadline for this deliverable is 15th February 11:59 PST. The primary objective is to evaluate the foundational API functionality under a single-user load.

A 1 User Load implies that each transaction involves a single user interacting with the system. However, multiple users may participate in the test. For instance, a user (company) might register, log in, and go through the initialization process to create multiple stocks. The scenarios presented will involve a variety of transactions, designed to assess the fundamental accuracy of API responses, but API calls will be sequential instead of parallel.

It's important to note that a transaction in this context refers to the creation, sale, purchase, partial sale, or partial purchase of stocks, or a combination of any of these actions.

The following provides an overview of the users involved and transactions being done:

- 1) Register a company account
- 2) Create stock "Google" and add stock to the company account
- 3) Create stock "Apple" and add stock to the company account
- 4) Place a limit sell order for Google from the company account
- 5) Place a limit sell order for Apple from the company account
- 6) Register a user and add money to its wallet
- 7) Place a buy market order for Google stock from user's account
- 8) Place a buy market order for Apple stock from user's account
- 9) Place a sell limit order for Google stock from user's account
- 10) Place a buy market order for Google stock from company's account
- 11) Place another buy market order for Google stock from company's account which should fail.
- 12) Cancel all pending transactions with status `PARTIALLY_COMPLETE`

The following table lists the test cases in sequence.

Important: For Jmeter assertions to work properly the following needs to be implemented:

1. Stock and wallet transactions should be sorted according to time stamp from oldest to newest.
2. For `/getStockPortfolio` and `/getStockPrices` sort according to stock name in lexicographically decreasing order ('Google' should come before 'Apple')

Http Method	Endpoint Name	Header	Request Body/ Query Params (If any)	Expected Response (JSON)
